

## Exim - настройка вторичного mail exchanger

Опубликовано muff в Вс, 2015-07-19 00:00

Переносил вторичный **mail exchanger (MX)** на новый сервер. Решил выложить инфу и конфиги - еще пригодится...

Исходные данные:

- Hostname: **mx2.kyivlink.com**
- IP: **195.12.59.26**
- Domain: **kyivlink.com**

Проверяем, куда указывают записи **mail exchanger** домена **kyivlink.com** (сервер мультидоменный, но тестировать будем на этом домене):

```
# host -t mx kyivlink.com
kyivlink.com mail is handled by 10 mail.kyivlink.com.
kyivlink.com mail is handled by 20 mx2.kyivlink.com.
```

**Важно!** Необходимо, чтобы "прямая" и "обратная" запись в **DNS** совпадали. То есть в нашем случае, необходимо чтобы запись **mx2.kyivlink.com** "резолвилась" в IP-адрес **195.12.59.26**, а **PTR**-запись для IP **195.12.59.26** была установлена в **mx2.kyivlink.com**.

Проверим, выполняются ли эти условия:

```
# host mx2.kyivlink.com.
mx2.kyivlink.com has address 195.12.59.26

# host 195.12.59.26
26.59.12.195.in-addr.arpa domain name pointer mx2.kyivlink.com.
```

В **DNS**-записях все в порядке. Приступим непосредственно к настройке **Exim**.

Внесем в **/etc/make.conf** следующий блок:

```
PORTSDIR?= /usr/ports
# EXIM
.if ${.CURDIR} == ${PORTSDIR}/mail/exim
LOG_FILE_PATH?= syslog
WITH_DEFAULT_CHARSET?= koi8-r
.endif
```

Выполним установку **Exim** из системы портов:

```
# cd /usr/ports/mail/exim && make install clean && rehash
```

При сборке указываем необходимость сборки с поддержкой **MySQL**:

```
[x] MYSQL      Enable mysql lookups
[x] SPF        Enable Sender Policy Framework checking
```

По завершению установки выводится список рекомендуемых действий:

To use Exim instead of sendmail on startup:

- \*) Clear the sendmail queue and stop the sendmail daemon.
- \*) Adjust mailer.conf(5) as appropriate.
- \*) Set the 'sendmail\_enable' rc.conf(5) variable to 'NONE'.
- \*) Set the 'daily\_status\_include\_submit\_mailq' and 'daily\_clean\_hoststat\_enable' periodic.conf(5) variables to 'NO'.
- \*) Consider setting 'daily\_queuerun\_enable' and 'daily\_submit\_queuerun' to "NO" in periodic.conf(5), if you intend to manage queue runners / deliveries closely.
- \*) Set the 'exim\_enable' rc.conf(5) variable to 'YES'.
- \*) Start exim with '/usr/local/etc/rc.d/exim start'.

You may also want to configure newsyslog(8) to rotate Exim log files:

```
/var/log/exim/mainlog  mailnull:mail 640 7 * @T00 ZN
/var/log/exim/rejectlog mailnull:mail 640 7 * @T00 ZN
```

Относительно настройки ротации логов (в конце рекомендаций) - можно пропустить этот пункт, поскольку в опциях сборки указывали, что логирование будет выполняться с помощью **syslog**, то есть логирование будет выполняться в **maillog**, настройка ротации которого уже выполнена.

А вот остальные рекомендации стоит выполнить.

Останавливаем **sendmail** и отключаем его поддержку в **rc.conf**:

```
# sh /etc/rc.d/sendmail forcestop
# echo '# Disable Sendmail' >> /etc/rc.conf
# echo 'sendmail_enable="NONE"' >> /etc/rc.conf
```

Файл **/etc/mail/mailer.conf** приводим к следующему состоянию:

```
sendmail      /usr/local/sbin/eximsend-mail      /usr/local/sbin/eximmailq
              /usr/local/sbin/exim -bpnewaliases      /usr/local/sbin/exim -bihoststat
/usr/local/sbin/eximpurgestat      /usr/local/sbin/exim
```

Настраиваем **periodic.conf**:

```
# echo 'daily_status_include_submit_mailq="NO"' >> /etc/periodic.conf
# echo 'daily_clean_hoststat_enable="NO"' >> /etc/periodic.conf
# echo 'daily_queuerun_enable="NO"' >> /etc/periodic.conf
# echo 'daily_submit_queuerun="NO"' >> /etc/periodic.conf
```

Остается только добавить поддержку **Exim** в **rc.conf** и запустить **Exim**. Однако, предварительно необходимо его настроить.

Отталкиваемся от того, что **MySQL [1]** и **Clamav [2]** установлены, настроены и работают.

Отредактируем **/usr/local/etc/exim/configure** до следующего содержания:

```
#####
Runtime configuration file for Exim      #####
```

```

```

Создадим базу данных **MySQL** и пользователя с правами на эту БД:

```
mysql> create database exim;
Query OK, 1 row affected (0,00 sec)

mysql> grant all on exim.* to 'exim'@'localhost' identified by 'MYSQL_PASS_HERE';
Query OK, 0 rows affected (0,00 sec)
```

Скачиваем дамп и заливаем его в БД:

```
# fetch http://muff.kiev.ua/files/exim_mx2.sql
# mysql -u exim -pMYSQL_PASS_HERE exim < exim_mx2.sql
```

**Внимание!** В моем случае, дамп БД готов для использования. Если же использовать на других серверах, необходимо изменить данные (можно и структуру, например, дефолтные значения) в таблицах **aliases** и **domains**.

Запускаем **exim**:

## Exim - настройка вторичного mail exchanger

Опубликовано muff.kiev.ua (<http://muff.kiev.ua>)

---

```
# sh /usr/local/etc/rc.d/exim start
```

Проверяем, запустился ли демон:

```
# ps -ax | grep exim  
70442 - ls      0:00,00 /usr/local/sbin/exim -bd -q30m
```

Демон запустился. Настройка **Exim** в роли вторичного **mail exchanger (MX)** завершена.
